Ethical Assistant Planner

NAME _____ **DATE** _____

> Plan your app on paper first.

1. Who is it for?

Pick one real person and one real problem.

My app helps _____ **with** _____

My welcome tells them to type _____

2. Pick one AI part

Circle one: `TextClassifier` · `TextRecommender` · `simple_llm` · your n-gram model, if you built one

3. Your decision plan

What can the user type, and what does your app do each time? This goes in the comments at the top of `main.py`.

WHEN THE USER TYPES...	MY APP DOES...
an empty line	
`quit`	says goodbye and stops

4. Turn it into code

Fill in the blanks. Your welcome line comes from section 1. Set up your AI part above the loop.

```
from mlms import _______________   # or: import simple_llm
print("Welcome! _____________________________ Type quit to stop.")
while True:
    user_input = input("You: ")
    if user_input.lower() == "quit":
        print("Goodbye!")
        break
    if user_input.strip() == "":
        print("_____________________________________________")
    else:
        _____________________________   # classify, recommend or ask_once
        print(_____________________________)
```

5. Test it

I TYPED	WHAT HAPPENED	WHAT I FIXED
something from my plan		
an empty line		
gibberish		
what someone very different from me might type
