Data Stories Planner

NAME _____ DATE _____

> Dataset: `broadway.csv`. Groups: Musical and Play. The first column is position 0.

Plan

`ShowType` position: _____ My number column (not `Weeks`): _____ position: _____

My question: Do musicals or plays have a higher average _____? **I expect:** _____

Fill in the loop:

```
kind = _____
col = _____
musical_total = 0
musical_count = 0
for row in rows:
    fields = row.split(",")
    if fields[kind] == "_____":
        musical_total = musical_total + float(fields[_____])
        musical_count = _____
musical_mean = _____ / _____
```

Add a total and a count for plays to the same loop, then `play_mean`. **Test it:** both counts add up to 798?

Mine: _____ My averages: musicals _____ plays _____
